

## Understanding FOIL

NAME: \_\_\_\_\_

The idea of this worksheet is to really understand why the FOIL system works for multiplying two binomials. We will investigate FOIL by looking at the area of a square. Recall, FOIL would be used in the following manner.

Say we want to multiply  $(x + 3)(x + 3)$ .

$$(x + 3)(x + 3)$$
$$= x^2 + 3x + 3x + 3^2$$
$$= x^2 + 6x + 9$$

Multiply the **FIRST** terms, the **OUTSIDE** terms, the **INSIDE** terms, and the **LAST** terms.

Let's examine the area of a square whose side has a length of  $x + 3$ . The area of a square is found by squaring the side length, so the area of this square would be  $(x + 3)^2$ .

Let's look at the square in pieces.

If we add the areas of the four interior pieces, we should get the whole area or  $(x+3)^2$ .

The sum of the four pieces is  $x^2 + 3x + 3x + 9$  or  $x^2 + 6x + 9$ .

Notice this is what you would get if you FOIL out  $(x+3)^2$  or  $(x+3)(x+3)$ .

When we incorrectly say  $(x+3)^2 = x^2 + 3^2$ , we are ignoring the two longer pieces of area  $3x$ .

Simplify the following expressions by multiplying them using FOIL. Draw squares similar to the one above and label their pieces to show that you are correct.

1.  $(x+4)^2$

2.  $(5+x)^2$

3.  $(2x + 3)^2$  (Ooh, this one is tricky! Define a length  $x$ , then make your side twice that plus three more.)

4.  $(x + 2)(2x + 3)$  (This will be a rectangle. Draw it out and then break it up into the four component pieces.)
